Create two classes, **`Book`** and **`Movie`**.

- A `Book` has only one property: **pages**.
- A `Movie` has only one property: **duration**.

Sort a list of books in **ascending** order of pages, and a list of movies in **descending** order of duration.

Condition: You must use the `Comparable` interface, and your entire program should contain **only one** `compareTo()` method that handles the sorting of both lists.

Use the following `main` method without changing it:

```
import java.util.*;

public class Main {
    public static void main(String[] args) {
        ArrayList<Book> books = new ArrayList<>();
        books.add(new Book(300));
        books.add(new Book(120));
        books.add(new Book(450));

        ArrayList<Movie> movies = new ArrayList<>();
        movies.add(new Movie(90));
        movies.add(new Movie(150));
        movies.add(new Movie(110));

        Collections.sort(books);
        Collections.sort(movies);

        // show the lists
    }
}
```
